pKa's. Numbers are approximations for outside the range -2-16, but useful to know.
For an extensive list, see http://www.chem.wisc.edu/areas/reich/pkatable/

| Substrate | $\mathrm{H}_{2} \mathrm{O}$ | DMSO | Substrate | $\mathrm{H}_{2} \mathrm{O}$ | DMSO |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Inorganics |  |  | EWG-CH |  |  |
| $\mathrm{CF}_{3} \mathrm{SO}_{3} \mathrm{H}$ | -14 |  | O |  |  |
| HCl | -8 |  |  | 9 | 13 |
| $\mathrm{CH}_{3} \mathrm{SO}_{3} \mathrm{H}$ | -3 | 2 | O |  |  |
| $\mathrm{H}_{3} \mathrm{O}+$ | -2 |  | EtO | 11 | 14 |
| $\mathrm{NH}_{4} \mathrm{Cl}$ | 9 |  | 0 |  |  |
| $\mathrm{H}_{2} \mathrm{O}$ | 16 |  | tO | 13 | 16 |
| Organic $X-H$ |  |  | $\mathrm{NO}_{2}$ | 10 | 17 |
| $\mathrm{H}_{\mathrm{O}^{+}}$ | -6 |  |  | 20 | 27 |
| $\mathrm{Ph} \mathrm{CH}_{3}$ |  |  |  |  |  |

| $(\mathrm{iPr})_{2} \mathrm{NH}$ |  | 36 |  | 23 |  |
| $\mathrm{NH}_{3}$ | 38 | 41 |  | 35 |  |

Bond Strength. Take from Lowry and Richardson; by definition, $\Delta \mathrm{H}$ for: $\mathrm{A}-\mathrm{B} \longrightarrow \mathrm{A}^{\bullet}+\mathrm{B}^{\bullet}$

Hydrogen bond | BDE $(\mathrm{Kcal} / \mathrm{mol})$ |  |
| :---: | :---: |
| $\mathrm{X}---\mathrm{H}$ | 28 |
| $\mathrm{H}-\mathrm{H}$ | 103 |
| $2-102$ |  |

$$

Strain energy (energetic penalty for indicated strain)
Strain

## Kinetics and Thermodynamics

equilibrium processes
key equation: $\Delta \mathrm{G}=-\mathrm{RT} \operatorname{Ln}(\mathrm{K})$
for $K=10, T=298, \Delta \mathbf{G}=\mathbf{- 1 . 4 k c a l}$
$K=100, T=298 \Delta G=-2.8 \mathrm{kcal}$
i.e. for every 1.4 kc al difference in energy there
is an order of magnitude change in $\mathrm{K}_{\text {eq }}$
reaction rate
2nd key equation
$k=\frac{k_{B} T}{h} \exp \left(\frac{-\Delta G^{\ddagger}}{R T}\right) \quad$ or $\quad \Delta G^{\ddagger}=-R T L n \quad \begin{gathered}k h \\ k_{B} T\end{gathered}$
$\mathrm{k}=$ rate constant
h = Plank's constant
$\mathrm{kb}=$ Boltzmann's constant
$-\Delta G^{\ddagger}=$ free energy difference between ground state and transition state
for $\mathrm{T}=298, \mathrm{k}=1 \mathrm{~s}^{-1}$
$\Delta G^{\ddagger}=17.5 \mathrm{kcal} / \mathrm{mol}$
i.e. activation energy for rxn occuring once a second is 17.5

As above, if $\mathrm{k}=10 \mathrm{~s}-1, \Delta \mathrm{G}^{\ddagger}=17.5-1.4=16.1$
For $\mathrm{T}=308$ and $\Delta \mathrm{G}^{\ddagger}=17.5, \mathrm{k}=2.5 \mathrm{~s}^{-1}$
i.e. increase in temp of 10 K gives $\sim 2.5$ fold increase in rate

## relative rates

for a system with 2 possible reaction pathways (e.g. kinetic enolization or asymmetric catalysis) for
$\mathrm{k}_{\text {fast }} / \mathrm{k}_{\text {slow }}=10$ (would give $82 \%$ ee), $\Delta \Delta \mathbf{G}^{\ddagger}=1.4 \mathrm{kcal} / \mathrm{mol}$
$\mathrm{k}_{\text {fast }} / \mathrm{k}_{\text {slow }}=100$ (would give $99 \%$ ee), $\Delta \Delta \mathbf{G}^{\ddagger}=\mathbf{2 . 8} \mathbf{k c a l} / \mathbf{m o l}$

## Bond distances

len (angstroms $\left[10^{-10} \mathrm{~m}\right]$ )
